

# CLEAR LIQUID RELEASE AGENT

**DESCRIPTION:** SS Clear Liquid Release Agent is a non-staining liquid that is used as a release agent for stamped concrete installations. The liquid has a pleasant “bubblegum” odor and allows for a crisp transfer of impression without the mess of powder.

**DIRECTIONS:** A contractor’s or industrial grade pump-up sprayer is recommended.

The SS Clear Liquid Release may be pigmented with a dry release agent to achieve an antiqued finish similar to that achieved with powder. When using this method it may be necessary to apply another application after the texture mats are pulled up as the color is sometimes concentrated in small spots. These are easily dissipated by another application of the pigmented release.

The Liquid Release evaporates after a short time, leaving very little residue behind. If a solvent base sealer is used, no cleaning is necessary prior to applying the sealer.

If a water base sealer is used, the recommended cleaning process is brush agitating with a mild detergent, similar to citrus cleaner, followed by a thorough rinsing.

**NOTE:** Each user should review these recommendations and determine their appropriateness. It is always recommended that the user test the product before use and should be comfortable with directions. Results may vary depending on conditions and use.
